2nd revision

The AE previously in the email dated 27 July 2022 required that I "*discuss the similarities and differences to the jamovi function and to this package*". So I have left the section near the end of the **Conclusions** section which details the similarities and differences between the package and the jamovi module for the named function.

To emphasise the importance of the likelihoodR package I have made two modifications.

- First, I have changed the first sentence of the 3rd paragraph of the **Conclusions** section to: "*One of the products of the likelihoodR package is that a module for jamovi (The jamovi project, 2021) is under development which will include many of these functions.*"
- Second, I have added a final concluding paragraph that reads: "*The likelihoodR package described in this article provides a large number of functions, currently many more than envisaged for the jamovi module. As such it will provide a major reference package for users who are interested in the likelihood approach.*"
